### PREFACE

## "God is a child; and when he began to play, he cultivated Mathematics. It is the godliest of man's games"

Good Education is defined as acquiring skills. There are many different ways to be educated and many subjects can be studied. A good education is one that teaches a student to think. Mathematics develops logic and skill of reasoning among students. Focus of this material is primarily to strengthen the mind to absorb the concepts and bring in the students the required self-confidence while learning the subject. Maths should be learnt with interest and it is made simple and approachable. The material is a supplement to the curriculum and arranged in a chronological manner as published in textbook. As per CBSE examination pattern Higher Order Thinking Skills questions with solutions can be found in each chapter. This will definitely facilitate students to approach examinations with ease and confidence. And finally, let the students remember that success is 1% inspiration and 99% perspiration. Hard work can never fail and will certainly help them reap rich rewards. Success will then become a habit for them.

"Seeing much, suffering much, and studying much, are the three pillars of learning" "Learning is a treasure that will follow its owner everywhere"

WE WISH ALL THE STUDENTS THE VERY BEST!!!

#### Chapter 2: Relations and Functions

#### **Concept:**

Notes:

- If (a,b) = (c,d) then a = c and b = d.
- $AxB = \{ (x,y) / x \in A, y \in B \}$
- $AxAxA = \{ (x,y,z) / x, y, z \in A \}$
- A relation R is a subset of the Cartesian product.
- A function is a relation with every element of first set has one only one image in second set.
- The set of all first elements of the ordered pairs in a function is called domain.
- The set of all second elements of the ordered pairs in a function is called the range.
- Second set itself is known as co-domain.

#### Chapter 4

#### PRINCIPLE OF MATHEMATICAL INDUCTION

#### INTRODUCTION

To prove certain results or statements in Algebra, that are formulated in terms of n, where n is a natural number, we use a specific technique called principle of mathematical induction (P.M.I)

#### Steps of P.M.I

Step I - Let p(n): result or statement formulated in terms of n (given question)

**Step II** – Prove that P(1) is true

Step III – Assume that P(k) is true

**Step IV** – Using step III prove that P(k+1) is true

**Step V** - Thus P(1) is true and P(k+1) is true whenever P(k) is true.

Hence by P.M.I, P(n) is true for all natural numbers n

#### Type I

Eg: Ex 4.1

1) Prove that  $1+3+3^2+\ldots+3^{n-1}=\frac{3^n-1}{2}$ 

Solution:-

Step I: Let P(n):  $1+3+3^2+...+3^{n-1} = \frac{3^n-1}{2}$ Step II: P(1): LHS = 1 RHS =  $=\frac{3-1}{2} = \frac{2}{2} = 1$ 

LHS=RHS Therefore p(1) is true. **Step III**: Assume that P(k) is true

i.e  $1+3+3^2+\ldots+3^{k-1}=\frac{3^{k}-1}{2}$  (1)

**Step IV**: we have to prove that P(k+1) is true.

ie to prove that  $1+3+3^2+\ldots+3^{k-1}+3 = \frac{3^{k+1}-1}{2}$ 

Proof  
LHS = 
$$(1+3+3^2+...+3^{k-1})+3$$
  
= $\frac{3^{k}-1}{2}+3^{k}$  from eq(1)

$$= \frac{3^{k} - 1 + 2 \cdot 3^{k}}{2}$$
$$= \frac{3 \cdot 3^{k} - 1}{2} = \frac{3^{k+1} - 1}{2} = RHS$$

Therefore P(k+1) is true

9

**Step V**: Thus P(1) is true and P(k+1) is true whenever P(k) is true. Hence by

P.M.I, P(n) is true for all natural number n.

**Ex 4.1** Q. 1,2, 3\*\*(HOT), 4, 5\*,6\*,7,8,9,10\*,11\*\*,12,13\*\*,14\*\*,15,16\*\*,17\*\*, eg 1, eg 3

#### Type 2

Divisible / Multiple Questions like Q.  $20^{**}$ , 21,  $22^{**}$ , 23 of Ex 4.1 eg 4, eg  $6^{**}$ (HOT) Q 22. Prove that  $3^{2n+2}$ -8n-9 is divisible by 8 for all natural number n. Solution Step I: Let p(n):  $3^{2n+2}$ -8n-9 is divisible by 8 Step II: P(1):  $3^4 - 8 - 9 = 81 - 17 = 64$  which is divisible by 8 Therefore p(1) is true Step III: Assume that p(k) is true i.e  $3^{2k+2}$ -8k-9 = 8m; m is a natural number. i.e  $3^{2k}$ .9 = 8m+8k+9 ie  $3^{2k} = 8m + 8k + 9$  (1) **Step IV:** To prove that p(k+1) is true.

ie to prove that  $3^{2k+4}$  -8(k+1) –9 is divisible by 8. Proof:  $3^{2k+4}$ -8k-17 =  $3^{2k}$ . $3^{4}$ -8k-17 =  $\left(\frac{8m+8k+9}{9}\right) \ge 3^{4}$  - 8k-17(from eqn (1))

= (8m+8k+9)9-8k-17 = 72m+72k+81-8k-17 = 72m-64k+64 = 8[9m-8k+8] is divisible by 8.

**Step V**: Thus P(1) is true and P(k+1) is true whenever P(k) is true. hence by P.M.I, P(n) is true for all natural numbers n.

Type III: Problems based on Inequations

Ex 4.1 Q. 18,14, eg 7

(Q 18) Prove that  $1+2+3+\ldots+n < \frac{(2n+1)^2}{8}$ 

**Step I** : Let P(n):  $1+2+3+\ldots+n < \frac{(2n+1)^2}{8}$ 

**Step II**: P(1):  $1 < \frac{9}{8}$  which is true, therefore p(1) is true.

Step III: Assume that P(k) is true. ie  $1+2+3+...+k < \frac{(2k+1)^2}{8}$  (1)

Step IV: We have to prove that P(k+1) is true. ie to prove that  $1+2+3+....+k+(k+1) < \frac{(2k+3)^2}{8}$ Proof: Adding (k+1) on both sides of inequation (1)  $1+2+3+....+k+(k+1) < \frac{(2k+1)^2}{8} + (k + 1)$   $= \frac{(4k^2+4k+1)+8k+8}{8}$   $= \frac{4k^2+12k+9}{8}$  $= (2k+3)^2$ 

Therefore 
$$1+2+3+...+k+(k+1) < \frac{(2k+3)^2}{8}$$

P(k+1) is true.

**Step V**: Thus P(1) is true and P(k+1) is true whenever P(k) is true. Hence by P.M.I, P(n) is true for all natural number n.

#### Chapter 5

#### **COMPLEX NUMBERS AND QUADRATIC EQUATIONS**

#### INTRODUCTION

 $\sqrt{-36}$ ,  $\sqrt{-25}$  etc do not have values in the system of real numbers. So we need to extend the real numbers system to a larger system.

Let us denote  $\sqrt{-1}$  by the symbol i.

ie  $i^2 = -1$ 

A number of the form a+ib where a&b are real numbers is defined to be a complex number.

Eg 2+i3,  $-7+\sqrt{2}i$ ,  $\sqrt{3}i$ ,  $4+\underline{1}i$ , 5=5+0i, -7=-7+0i etc

For z = 2+i5, Re z = 2 (real part)

and Im z = 5 (imaginary part)

Refer algebra of complex numbers of text book pg 98

1) Addition of complex numbers

(2+i3) + (-3+i2) = (2+-3) + i(3+2)= -1+5i

2) Difference of complex numbers (2+i3)-(-3+i2) = (2+3) + i(3-2)

3) Multiplication of two complex numbers

(2+i3)(-3+i2) = 2(-3+i2) + i3(-3+i2)= -6+4i-9i+6i<sup>2</sup> = -6-5i-6 (i<sup>2</sup> = -1) = -12-5i

4) Division of complex numbers

$$\frac{2+i3}{-3+i2} = \frac{(2+i3)}{(-3+i2)} \times \frac{(-3-i2)}{(-3-i2)}$$
$$= \frac{-6-4i-9i-6i^{2}}{(-3)^{2}-(i2)^{2}}$$
$$= \frac{-6-13i+6}{9-(-1)\times 4}$$
$$= \frac{-13i}{13} = \underline{-i}$$

#### 5) Equality of 2 complex numbers

a+ib = c+id, iff a=c & b=d

6) a+ib =0, iff a=0 and b=0
Refer : the square roots of a negative real no & identities (text page 100,101)

#### Formulas

- a) IF Z=a+ib then modulus of Z ie  $|Z| = (a^2+b^2)^{1/2}$
- b) Conjugate of Z is a-ib
- c) Multiplicative inverse of  $\mathbf{a}+\mathbf{ib} = \frac{\mathbf{a}}{(\mathbf{a}^2+\mathbf{b}^2)} \frac{\mathbf{ib}}{(\mathbf{a}^2+\mathbf{b}^2)}$

\*\*d) Polar representation of a complex number

 $\begin{array}{|c|c|c|c|c|c|} \hline a+ib = r(\cos \varphi + i\sin \varphi) \\ \hline Where r = & Z & = (a^2+b^2)^{1/2} \text{ and } \varphi = \arg Z(\text{argument or amplitude of } Z \text{ which} \\ \hline has many different values but when <math>-\pi < \varphi \le \pi$ ,  $\varphi$  is called principal argument of Z.

#### Trick method to find o

Step 1 First find angle using the following

- 1)  $\cos \theta = 1$  and  $\sin \theta = 0$  then angle = 0
- 2)  $\cos \theta = 0$  and  $\sin \theta = 1$  then angle  $= \pi/2$
- 3) Sin $\theta = \sqrt{3}/2$  and cos $\theta = 1/2$  then angle =  $\pi/3$
- 4) Sine =  $\frac{1}{2}$  and cose =  $\sqrt{3}/2$  then angle =  $\pi/6$

Step 2: To find o

- 1) If both sine and  $\cos \theta$  are positive then  $\theta$  = angle (first quadrant)
- 2) If sino positive,  $\cos \theta$  negative then  $\theta = \pi$ -angle (second quadrant)
- 3) If both sine and cose are negative the  $e^{\pi}$  angle (third quadrant)

4) If sino negative and coso positive then  $\theta = 2\pi$ -angle (fourth quadrant)

Or  $\theta = -(angle)$  since  $\sin(-\theta) = -\sin\theta$  and  $\cos(-\theta) = \cos\theta$ 

5) If  $\sin \theta = 0$  and  $\cos \theta = -1$  then  $\theta = \pi$ 

#### \*\*e) Formula needed to find square root of a complex number

$$(a+b)^{2} = (a-b)^{2} + 4ab$$
  
ie  $[x^{2} + y^{2}]^{2} = [x^{2} - y^{2}]^{2} + 4x^{2}y^{2}$ 

 $\mathbf{i}\mathbf{i}\mathbf{i}\mathbf{i}^{4k+1} = \mathbf{i}$ 

iii) $i^{4k+2} = -1$ 

iv)  $i^{4k+3} = -i$ , for any integer k

#### **Examples:**

 $i^{1} = i, i^{2} = -1, i^{3} = -i$  and  $i^{4} = 1\&$  $i^{19} = i^{16} \times i^{3} = 1 \times -i = -i$ 

g) Solutions of quadratic equation  $ax^2+bx + c = 0$  with real coefficients a,b,c and  $a \neq 0$  are given by  $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$ , If  $b^2 - 4ac \ge 0$ 

If b<sup>2</sup>- 4ac < 0 then  $\boldsymbol{x} = \frac{-\boldsymbol{b} \pm \sqrt{4ac - b^2}}{2a}$  i

#### **Polar form (very important)**

#### Ex 5.2

Q 2\*\*) Express Z =  $-\sqrt{3}+i$  in the polar form and also write the modulus and the argument of Z

Solution Let  $-\sqrt{3}+i = r(\cos\theta + i\sin\theta)$ 

Here  $a = -\sqrt{3}$ , b = 1

$$r = (a^2 + b^2)^{1/2} = \sqrt{3+1} = \sqrt{4} = 2$$

 $-\sqrt{3}+i = 2\cos\theta + i \ge 2\sin\theta$ 

Therefore  $2\cos\theta = -\sqrt{3}$  and  $2\sin\theta = 1$ 

 $\cos \theta = -\sqrt{3}/2$  and  $\sin \theta = \frac{1}{2}$ 

Here coso negative and sino positive

Therefore  $\Theta = \pi \cdot \pi/6 = 5\pi/6$  (see trick method given above) Therefore polar form of  $Z = -\sqrt{3} + i = 2(\cos 5\pi/6 + i\sin 5\pi/6)$  |Z| = 2 and argument of  $Z = 5\pi/6$  and  $-\sqrt{3} + i = 2(\cos 5\pi/6 + i\sin 5\pi/6)$  **Ex 5.2** Q (1 to 8)\*\* Note: Q 1)  $\Theta = 4\pi/3$  or principal argument  $\Theta = 4\pi/3 - 2\pi = -2\pi/3$ Q 5)  $\Theta = 5\pi/4$  or principal argument  $\Theta = 5\pi/4 - 2\pi = -3\pi/4$

#### LINEAR INEQUALITIES

## Rules for solving inequalities

The following rules can be applied to any inequality

> Add or subtract the same number or expressions to both sides.

> Multiply or divide both sides by the same positive number.

> By multiplying or dividing with the same negative number, the inequality is reversed.

>a<b implies b>a

➤a<b implies -a>-b

➤a<b implies 1/a >1/b

>x<sup>2</sup>≤a<sup>2</sup> implies x≤a and x≥-a

#### Recall

 $rac{}{}x = 0$  is y axis

y=0 is x axis

>x=k is a line parallel to y axis passing through (k,0)of x axis.

>y=k is a line parallel to x axis and passing through (0,k)of y axis.

#### Procedure to solve a linear inequality

 $\,\circ\,$  Simplify both sides by removing group symbols and collecting like terms.

 $\circ\,$  Remove fractions by multiplying both sides by an appropriate factor.

 $\ensuremath{\circ}$  Isolate all variable terms on one side and all constants on the other side.

 $\circ$  Make the coefficient of the variable 1 and get the solution (whenever coefficient of x is negative multiply through out by -1 so that the ineqality is reversed.

 $Eg - 2x \ge 5$ 

2x ≤ -5

x ≤-5/2

 $x \le -2.5$  therefore solution is  $(-\infty, -2.5]$ 

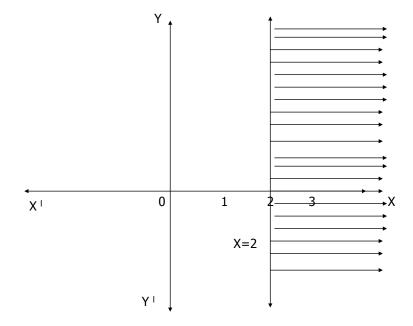

**Note:** If  $x \ge 0$ ,  $y \ge 0$  is given in question every point in the shaded region in the **first quadrant** including the points on the line and the axis, represents the solution of the given system of ineqalities.

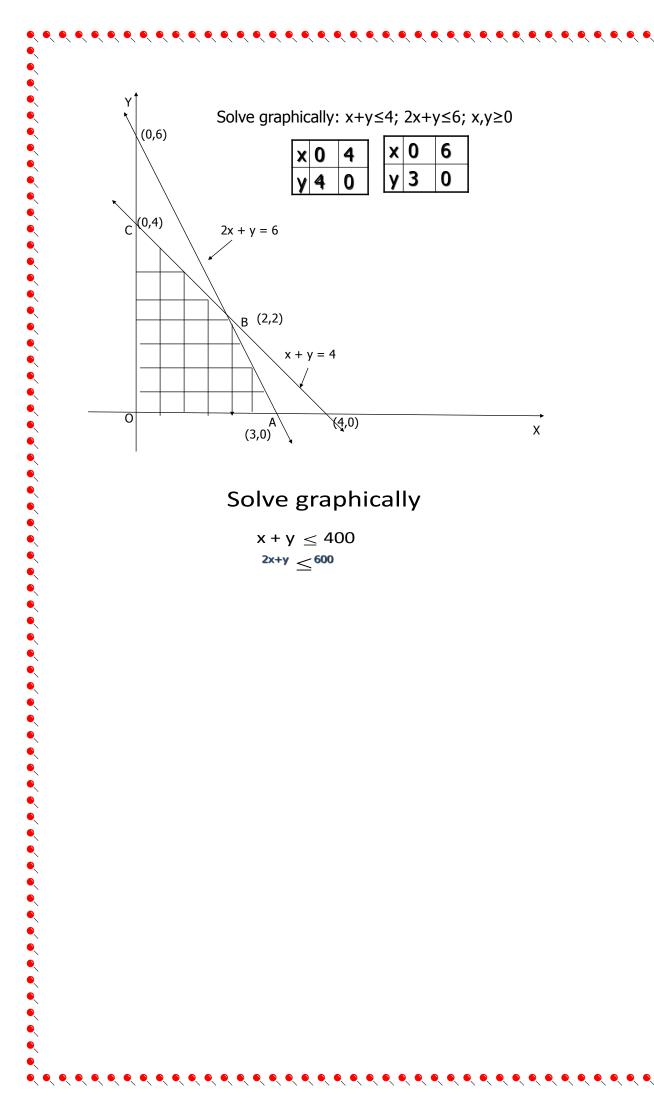

## Method to find Graphical Solution

- Draw lines corresponding to each equation treating it as equality
- Find the Feasible Region intersection of all the inequalities Steps to find Feasible region
- Step 1: Take any point on the left (down) or right (up) of the line and substitute that in the given inequality.
- Step 2: If the point satisfies the inequality, the region containing that point is the required region. Otherwise opposite region is the required region.
- Step 3: If inequality is of the type  $\geq$ ,  $\leq$  then the points on the line are also included in the solution region, so draw dark lines.
- Step 4: If inequality is of the type >, < then the points on the line are not included in the solution region, so draw dotted lines

Note: For the following in equation  $x \ge 2$ , substitute the point (0,0) (left side) in  $x \ge 2$ . Then we get  $0 \ge 2$  which is false. Therefore right side is the required region.

Shade the region corresponding to the inequation  $x \ge 2$

#### PERMUTATIONS (Arrangements) AND COMBINATIONS (selections)

In permutation **order is important**, since 27 & 72 are different numbers(arrangements). In combination order is not important.

#### • Fundamental principle of counting (FPC)

then by FPC there are mn ways to go from station A to station C

The number of permutations of n different things taken r at a time, where repetition is not allowed is given by <sup>n</sup>P<sub>r</sub> = n(n-1)(n-2).....(n-r+1) where 0<r<n.</li>

eg 
$${}^{5}P_{2} = 5 \times 4$$

 ${}^{7}P_{3} = 7 \times 6 \times 5 = 210$ 

= 20

• Factorial notation:  $\mathbf{n!} = 1 \times 2 \times 3 \times \dots \times \mathbf{n}$ , where **n** is a natural number eg 5! = 1 x 2 x 3 x 4 x 5

```
we define 0! = 1
also n! = n(n-1)!
```

$$= n(n-1)(n-2)!$$

- ${}^{n}P_{r} = \underline{\underline{n!}}$  Where  $0 \le r \le n$ (n-r)!
- Number of permutations of n different things, taken r at a time, where repetition is allowed is **n**<sup>r</sup>
- Number of permutations of n objects taken all at a time, where P<sub>1</sub> objects are of first kind, P<sub>2</sub> objects are of second kind.....P<sub>k</sub> objects are of the k<sup>th</sup> kind and rest, if any, are all different is <u>n!</u> (eg 9)

$$P_1!.P_2!...P_k!$$
